

Frozen Semen Insemination Protocol
For a Mare Resident at Brendon Stud 2018

1. Breeding soundness examination at mare owner's yard or at Brendon stud. If not in season then induce oestrus with prostaglandin. If in season then an endometrial swab and smear will be taken. Usually done on a Friday.
2. When in season endometrial swab and smear, usually the following Monday after prostaglandin administration. Follicles are assessed daily until a 3 to 3.5cm follicle is observed with a good oedema pattern. Ovulating agent will be administered on that day at approximately 6pm.
3. The follicles will be checked the next day.
4. The mare will be inseminated approximately 36 to 40 hours after the ovulation injection using a deep intrauterine insemination technique. To get the correct timing she will be examined every 3 to 4 hours, from approximately 34 hours after ovulation agent injection, until ovulation takes place, she will then be served post ovulation.
5. The mare will be examined 12 hours after insemination and if required the uterus will be lavaged with sterile saline, intrauterine antibiotics and/or oxytocin administered.
6. A pregnancy ultrasound scan will then be performed at 14 and 16 days, at the practice, the Stud or at the mare owner's yard if within the practice locality.
7. If the mare is in foal then further pregnancy scans are advised to be carried out at 28 and 42 days post insemination.
8. If the mare is empty at any stage the above process is repeated.

Frozen Semen Insemination Protocol
Fixed Price Package Per Cycle for a Mare Resident at Brendon Stud

This includes:

All mares will be swabbed at the start of the first examination for Contagious Equine Metritis – CEM.

- Breeding soundness examination at the mare owner's yard (if within practice locality) or Brendon stud.
- Induction of oestrus with prostaglandin.
- The ultrasound examinations to assess when best to induce ovulation.
- Endometrial swabs and smears to check clean prior to insemination.
- Induction of ovulation using an ovulation agent.
- Insemination using a deep intrauterine technique.
- Post insemination examinations.
- Oxytocin injections if required.
- Squeezing twins and the follow up examinations required.
- Caslicks procedure if the mare has a poor vulval seal.
- A pregnancy scan (including visit if within practice locality) at 14 and 16 days.

The package does not include:

- Treatment of pre-inseminating uterine infections detected on swab and smear.
- Any treatment required, such as intrauterine antibiotics or saline lavage, to treat uterine inflammation pre or post insemination.
- Endometrial biopsy.
- Subsequent pregnancy scans after 16 days.
- Treatment of any condition not associated directly with breeding of the mare or foal at foot.

The cost of the frozen semen protocol is £370 + VAT for the first cycle. If the mare is not in foal subsequent cycles will be charged at £250 + VAT per cycle.

All efforts are made to contact owners to obtain approval of non stud medicine related treatment, however, should an emergency arise necessitating treatment of the mare or foal at foot then this will be done after consultation with the stud owner/manager. The practice reserves the right to perform procedures or treatment deemed necessary to ensure animal welfare.
